

CS 161A/B: Programming and Problem Solving I

Algorithm Design Document – Assignment _

Make a copy before you begin (File -> Make a copy). Add the Assignment # above and complete the sections below *BEFORE* you begin to code. The sections will expand as you type. When you are finished, download this document as a PDF (File -> Download -> PDF) and submit to D2L.

This document contains an interactive checklist. To mark an item as complete, click on the box (the entire list will be highlighted), then right click (the clicked box will only be highlighted), and choose the checkmark.

Planning your program before you start coding is part of the development process. In this document you will:

- ☐ Paste a screenshot of your zyBooks Challenge and Participation %
- ☐ Paste a screenshot of your assigned zyLabs completion
- ☐ Write a detailed description of your program, at least two complete sentences
- ☐ If applicable, design a sample run with test input and output
- ☐ Identify the program inputs and their data types
- ☐ Identify the program outputs and their data types
- ☐ Identify any calculations or formulas needed
- ☐ Write the algorithmic steps as pseudocode or a flowchart
- ☐ Tools for flowchart - [Draw.io](#) - [Diagrams.net](#)

1. zyBooks

Add your zyBooks screenshots for the % and assigned zyLabs completions below. Required percentages: all **assigned** zyLabs, Challenge Activity with at least 70%, and Participation Activity with at least 80%.

Challenge and Participation % screenshot:

Assigned zyLabs completion screenshot:

<input type="checkbox"/>	1.21 LAB: Warm up: Basic output with variables	Optional	<div><div></div></div> 0%	▼
<input type="checkbox"/>	1.22 LAB: Formatted output: Hello World!		<div><div></div></div> 100%	▼
<input type="checkbox"/>	1.23 LAB: Formatted output: No parking sign		<div><div></div></div> 100%	▼

2. Program Description

In the box below, describe the purpose of the program. You must include a detailed description with at least two complete sentences.

Program description:

This tool will help you order the correct amount of pizzas for your party. You will be prompted to enter the number of people, and then this program will output the number of pizza's needed to be purchased alongside the total cost of the order.

3. Sample Run

If you are designing your own program, you will start with a sample run. Imagine a user is running your program - what will they see? What inputs do you expect, and what will be the outputs from the given inputs? Choose test data you will use to test your program. Calculate and show the expected outputs. Use the sample run to test your program.

Sample run:

Hello - welcome to my pizza order calculator!

This tool will help you order the correct number of pizza's for a given party size.

Please enter the number of people attending this party: **7**

Total number of pizzas required for 7 is: 2 pizza(s)

The total cost of all pizzas will be: \$29.90

Thank you for using my pizza calculator!

4. Algorithmic Design

Before you begin coding, **you must first plan out the logic** and think about what data you will use to test your program for correctness. All programmers plan before coding - this saves a lot of time and frustration! Use the steps below to identify the inputs and outputs, calculations, and steps needed to solve the problem.

Use the pseudocode syntax shown in the document, supplemented with English phrases if necessary. **Do not include any implementation details (e.g. source code file names, class or struct definitions, or language syntax).** Do not include any C++ specific syntax or data types.

Algorithmic design:

- a. Identify and list all of the user input and their data types. Include a variable name, data type, and description. Data types include string, integer, floating point, (single) character, and boolean. Data structures should be referenced by name, e.g. "array of integer" or "array of string" (for CS161B and up).

INPUT numPeople AS Int

- b. Identify and list all of the user output and their data types. Include a variable name, data type, and description. Data types include string, integer, floating point, (single) character, and boolean. Data structures should be referenced by name, e.g. "array of integer" or "array of string" (for CS161B and up).

numPeople – Integer; numPizza – Integer

costPizza – Float

- c. What calculations do you need to do to transform inputs into outputs? List all formulas needed, if applicable. If there are no calculations needed, state there are no calculations for this algorithm. Formulae should reference the variable names from step a and step b as applicable.

SET numPizza = (numPeople * 2) / 12

COMPARE Float(numPizza) TO Int(numPizza)

SET costPizza = numPizza * 14.95

- d. Design the logic of your program using pseudocode or flowcharts. Here is where you would use conditionals, loops or functions (if applicable) and list the steps in transforming inputs into outputs. Walk through your logic steps with the test data from the assignment document or the sample run above.

Use the syntax shown at the bottom of this document and plain English phrases. Do not include any implementation details (e.g. file names) or C++ specific syntax.

START

DECLARE Int numPeople

DECLARE Float numPizza

DECLARE Float costPizza

DISPLAY "Hello - welcome to my pizza order calculator!"

DISPLAY "This tool will help you order the correct number of pizza's for a given party size."

DISPLAY "Please enter the number of people attending this party: "

INPUT numPeople

SET numPizza = (numPeople * 2) / 12

IF Int(numPizza) != numPizza

- - SET numPizza = Int(numPizza + 1)

SET costPizza = numPizza * 14.95

DISPLAY "Total number of pizzas required for {numPeople} is: {numPizza} pizza(s)"

DISPLAY "The total cost of all pizzas will be: \${costPizza}"

```
DISPLAY "Thank you for using my pizza calculator!"  
END
```

5. Pseudocode Syntax

Think about each step in your algorithm as an action and use the verbs below:

To do this:	Use this verb:	Example:
Create a variable	DECLARE	DECLARE integer num_dogs
Print to the console window	DISPLAY	DISPLAY "Hello!"
Read input from the user into a variable	INPUT	INPUT num_dogs
Update the contents of a variable	SET	SET num_dogs = num_dogs + 1
Conditionals		
Use a single alternative conditional	IF <i>condition</i> THEN <i>statement</i> <i>statement</i> END IF	IF num_dogs > 10 THEN DISPLAY "That is a lot of dogs!" END IF
Use a dual alternative conditional	IF <i>condition</i> THEN <i>statement</i> <i>statement</i> ELSE <i>statement</i> <i>statement</i> END IF	IF num_dogs > 10 THEN DISPLAY "You have more than 10 dogs!" ELSE DISPLAY "You have ten or fewer dogs!" END IF
Use a switch/case statement	SELECT <i>variable or expression</i> CASE <i>value_1</i> : <i>statement</i> CASE <i>value_2</i> : <i>statement</i> CASE <i>value_2</i> : <i>statement</i> DEFAULT: <i>statement</i> <i>statement</i>	SELECT num_dogs CASE 0: DISPLAY "No dogs!" CASE 1: DISPLAY "One dog.." CASE 2: DISPLAY "Two dogs.." CASE 3: DISPLAY "Three dogs.." DEFAULT: DISPLAY "Lots of dogs!" END SELECT

	END SELECT	
Loops		
Loop while a condition is true - the loop body will execute 0 or more times.	WHILE <i>condition</i> <i>statement</i> <i>statement</i> END WHILE	SET num_dogs = 1 WHILE num_dogs < 10 DISPLAY num_dogs, " dogs!" SET num_dogs = num_dogs + 1 END WHILE
Loop while a condition is true - the loop body will execute 1 or more times.	DO <i>statement</i> <i>statement</i> WHILE <i>condition</i>	SET num_dogs = 1 DO DISPLAY num_dogs, " dogs!" SET num_dogs = num_dogs + 1 WHILE num_dogs < 10
Loop a specific number of times.	FOR <i>counter</i> = <i>start</i> TO <i>end</i> <i>statement</i> <i>statement</i> END FOR	FOR count = 1 TO 10 DISPLAY num_dogs, " dogs!" END FOR
Functions		
Create a function	FUNCTION <i>return_type</i> <i>name</i> (<i>parameters</i>) <i>statement</i> <i>statement</i> END FUNCTION	FUNCTION Integer add(Integer num1, Integer num2) DECLARE Integer sum SET sum = num1 + num2 RETURN sum END FUNCTION
Call a function	CALL <i>function_name</i>	CALL add(2, 3)
Return data from a function	RETURN <i>value</i>	RETURN 2 + 3
