CS 161A: Programming and Problem Solving I

Assignment A06 Sample Algorithmic Design Document

Make a copy before you begin (File -> Make a copy). Add the Assignment # above and complete the sections below BEFORE you begin to code. The sections will expand as you type. When you are finished, download this document as a PDF (File -> Download -> PDF) and submit to D2L.

This document contains an interactive checklist. To mark an item as complete, click on the box (the entire list will be highlighted), then right click (the clicked box will only be highlighted), and choose the checkmark.

Planning your program before you start coding is part of the development process. In this document you will:

- ❏ Paste a screenshot of your zyBooks Challenge and Participation %
- ❏ Paste a screenshot of your assigned zyLabs completion
- ❏ Write a detailed description of your program, at least two complete sentences
- ❏ If applicable, design a sample run with test input and output
- ❏ Identify the program inputs and their data types
- ❏ Identify the program outputs and their data types
- ❏ Identify any calculations or formulas needed
- ❏ Write the algorithmic steps as pseudocode or a flowchart
- ❏ Tools for flowchart - Draw.io - Diagrams.net

1. zyBooks

Add your zyBooks screenshots for the % and assigned zyLabs completions below. Required percentages: all **assigned** zyLabs, Challenge Activity with at least 70%, and Participation Activity with at least 80%.

Challenge and Participation % screenshot:

☐ 6. CS 161A: Loops Part I	🟩 100% 🟦 76% 🟧 100% ∧

Assigned zyLabs completion screenshot:

☐	6.13 LAB: Warm up: Drawing a right triangle	■ 100%	⌄
☐	6.14 LAB: Varied amount of input data	■ 100%	⌄
☐	6.15 LAB: Convert to reverse binary	■ 100%	⌄

2. Program Description

In the box below, describe the purpose of the program. You must include a detailed description with at least two complete sentences.

Program description:
This program will calculate the total cost of a pizza order when given the number of people, average slices eaten, and the cost of each pizza.

3. Sample Run

If you are designing your own program, you will start with a sample run. Imagine a user is running your program - what will they see? What inputs do you expect, and what will be the outputs from the given inputs? Choose test data you will use to test your program. Calculate and show the expected outputs. Use the sample run to test your program.

Sample run:
Welcome to my Pizza Party Statistics program! Enter the number of people, average number of slices per person, and the cost of a pizza separated by a space: **15 1.97 12.95** Number of pizzas: 4 Cost of pizzas: $51.80 Tax: $3.63 Delivery: $11.09 Total Cost: $66.51 Do you want to enter more (y/n): **n** Thank you for using my program!
Welcome to my Pizza Party Statistics program!

```
Enter the number of people, average number of slices per person, and
the cost of a pizza separated by a space: 500 1.5 9.75

Number of pizzas: 94
Cost of pizzas:  $916.50
Tax:             $64.16
Delivery:        $196.13
Total Cost:      $1176.79

Do you want to enter more (y/n): y

Enter the number of people, average number of slices per person, and
the cost of a pizza separated by a space: 12 7 10.8

Number of pizzas: 11
Cost of pizzas:  $118.80
Tax:             $8.32
Delivery:        $25.42
Total Cost:      $152.54

Do you want to enter more (y/n): n

Thank you for using my program!
```

```
Welcome to my Pizza Party Statistics program!

Enter the number of people, average number of slices per person, and
the cost of a pizza separated by a space: 2 4 19.95

Number of pizzas: 1
Cost of pizzas:  $19.95
Tax:             $1.40
Delivery:        $4.27
Total Cost:      $25.62

Do you want to enter more (y/n): n

Thank you for using my program!
```

4. Algorithmic Design

Before you begin coding, **you must first plan out the logic** and think about what data you will use to test your program for correctness. All programmers plan before coding - this saves a lot of time and frustration! Use the steps below to identify the inputs and outputs, calculations, and steps needed to solve the problem.

Algorithmic design:

a. Identify and list all of the user input and their data types.

Int numPeople
Double numSlicesEaten
Double unitCost
String newOrder

b. Identify and list all of the user output and their data types.

Int numPizza
Double pizzaTotalCost
Double orderTax
Double deliverycost
Double orderTotal

c. What calculations do you need to do to transform inputs into outputs? List all formulas needed, if applicable. If there are no calculations needed, state there are no calculations for this algorithm.

numSlicesReq = numPeople * numSlicesEaten;
numPizza = ceil(numSlicesReq / PIZZA_SERVINGS); // Global is 8
pizzaTotalCost = unitCost * numPizza;
orderTax = pizzaTotalCost * 0.07;
deliveryCost = (pizzaTotalCost + orderTax) * 0.20;
orderTotal = pizzaTotalCost + orderTax + deliveryCost;

d. Design the logic of your program using pseudocode or flowcharts. Here is where you would use conditionals, loops or functions (if applicable) and list the steps in transforming inputs into outputs. Walk through your logic steps with the test data from the assignment document or the sample run above.

```
START

DECLARE Global Int PIZZA_SERVINGS = 8

DECLARE string newOrder = ""

DECLARE Int numPeople = 0

DECLARE Double numSlicesEaten = 0.0

DECLARE Double numSlicesReq = 0.0

DECLARE Double unitCost = 0.0

DECLARE Int numPizza = 0

DECLARE Double deliveryCost = 0.0

DECLARE Double pizzaTotalCost = 0.0

DECLARE Double orderTax = 0.0

DECLARE Double orderTotal = 0.0

DISPLAY "Welcome to my Pizza Party Statistics program!"

DO

- - DISPLAY "Enter the number of people, average number of slices per person, and

- - the cost of a pizza separated by a space: "

- - INPUT numPeople

- - INPUT numSlicesEaten

- - INPUT unitCost

- -

- - SET numSlicesReq = numPeople * numSlicesEaten
```

```
- - SET numPizza = ceil(numSlicesReq / PIZZA_SERVINGS)

- - SET pizzaTotalCost = unitCost * numPizza

- - SET orderTax = pizzaTotalCost * 0.07

- - SET deliveryCost = (pizzaTotalCost + orderTax) * 0.20

- - SET orderTotal = pizzaTotalCost + orderTax + deliveryCost

- -

- - DISPLAY "Number of pizzas: {numPizza}"

- - DISPLAY "Cost of pizzas:  ${pizzaTotalCost}"

- - DISPLAY "Tax:          ${orderTax}"

- - DISPLAY "Delivery:      ${deliveryCost}"

- - DISPLAY "Total Cost:     ${orderTotal}"

- -

- - DISPLAY "Do you want to enter more (y/n): "

- - INPUT newOrder

- - SET newOrder = lower(newOrder)

WHILE newOrder == "y"

DISPLAY "Thank you for using my program!"

END
```

5. Pseudocode Syntax

Think about each step in your algorithm as an action and use the verbs below:

To do this:	Use this verb:	Example:
Create a variable	DECLARE	`DECLARE integer num_dogs`

Print to the console window	DISPLAY	```DISPLAY "Hello!"```
Read input from the user into a variable	INPUT	```INPUT num_dogs```
Update the contents of a variable	SET	```SET num_dogs = num_dogs + 1```

Conditionals

Use a single alternative conditional	IF *condition* THEN
	    statement
	    statement
	END IF
		```IF num_dogs > 10 THEN```
		``` DISPLAY "That is a lot of```
		```dogs!"```
		```END IF```

Use a dual alternative conditional	IF *condition* THEN
	    statement
	    statement
	ELSE
	    statement
	    statement
	END IF
		```IF num_dogs > 10 THEN```
		``` DISPLAY "You have more than```
		```10 dogs!"```
		```ELSE```
		``` DISPLAY "You have ten or```
		```fewer dogs!"```
		```END IF```

Use a switch/case statement	SELECT *variable or expression*
	    CASE *value_1:*
	        statement
	        statement
	    CASE *value_2:*
	        statement
	        statement
	    CASE *value_2:*
	        statement
	        statement
	    DEFAULT:
	        statement
	        statement
	END SELECT
		```SELECT num_dogs```
		``` CASE 0: DISPLAY "No dogs!"```
		``` CASE 1: DISPLAY "One dog.."```
		``` CASE 2: DISPLAY "Two dogs.."```
		``` CASE 3: DISPLAY "Three dogs.."```
		``` DEFAULT: DISPLAY "Lots of```
		```dogs!"```
		```END SELECT```

Loops

Loop while a condition is true - the loop body will execute 0 or more times.	WHILE *condition*
	    statement
	    statement
	END WHILE
		```SET num_dogs = 1```
		```WHILE num_dogs < 10```
		``` DISPLAY num_dogs, " dogs!"```
		``` SET num_dogs = num_dogs + 1```
		```END WHILE```

Loop while a condition is true - the loop body will execute 1 or more times.	DO
	    statement
	    statement
	WHILE *condition*
		```SET num_dogs = 1```
		```DO```
		``` DISPLAY num_dogs, " dogs!"```
		``` SET num_dogs = num_dogs + 1```
		```WHILE num_dogs < 10```

Loop a specific number of times.	FOR *counter* = *start* TO *end*
	    statement
	    statement
	END FOR
		``
		FOR count = 1 TO 10
		    DISPLAY num_dogs, " dogs!"
		END FOR
		``

Functions		

Create a function	FUNCTION *return_type*
	name (parameters)
	    statement
	    statement
	END FUNCTION
		``
		FUNCTION Integer add(Integer
		num1, Integer num2)
		    DECLARE Integer sum
		    SET sum = num1 + num2
		    RETURN sum
		END FUNCTION
		``

Call a function	CALL *function_name*	``` CALL add(2, 3) ```
Return data from a function	RETURN *value*	``` RETURN 2 + 3 ```
